

# Scott County Syringe Service Program (SSP)

2015-2021

# About

- Started in 2015 to combat the spread of HIV and HepC
- Hybrid Needs-Based Program

CDC supports the needs-based approach to syringe distribution, as the evidence shows that this is the best practice for reducing new HIV and viral hepatitis infections.

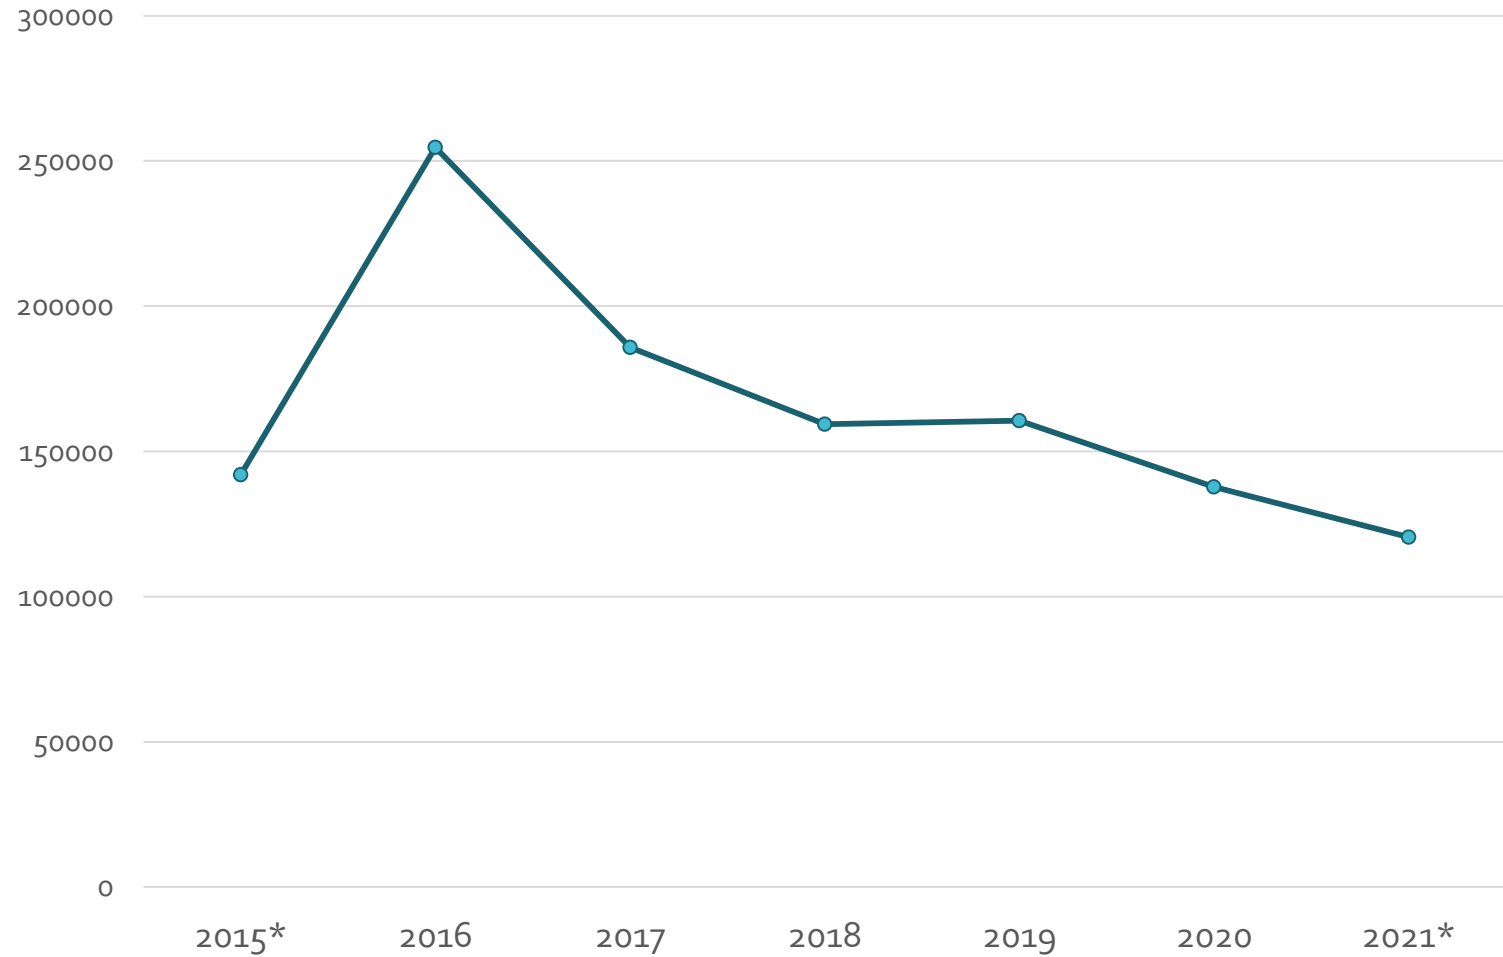

If a participant does not bring back their syringes we provide them with 1 pack of 10 syringes to restart their exchange.

- Program is available to PWID and diabetics.
- Community Sharps Boxes in to prevent improper disposal.

2015 is only a partial year of data (April-December).

2021 is an estimated projection based on Q1 data.

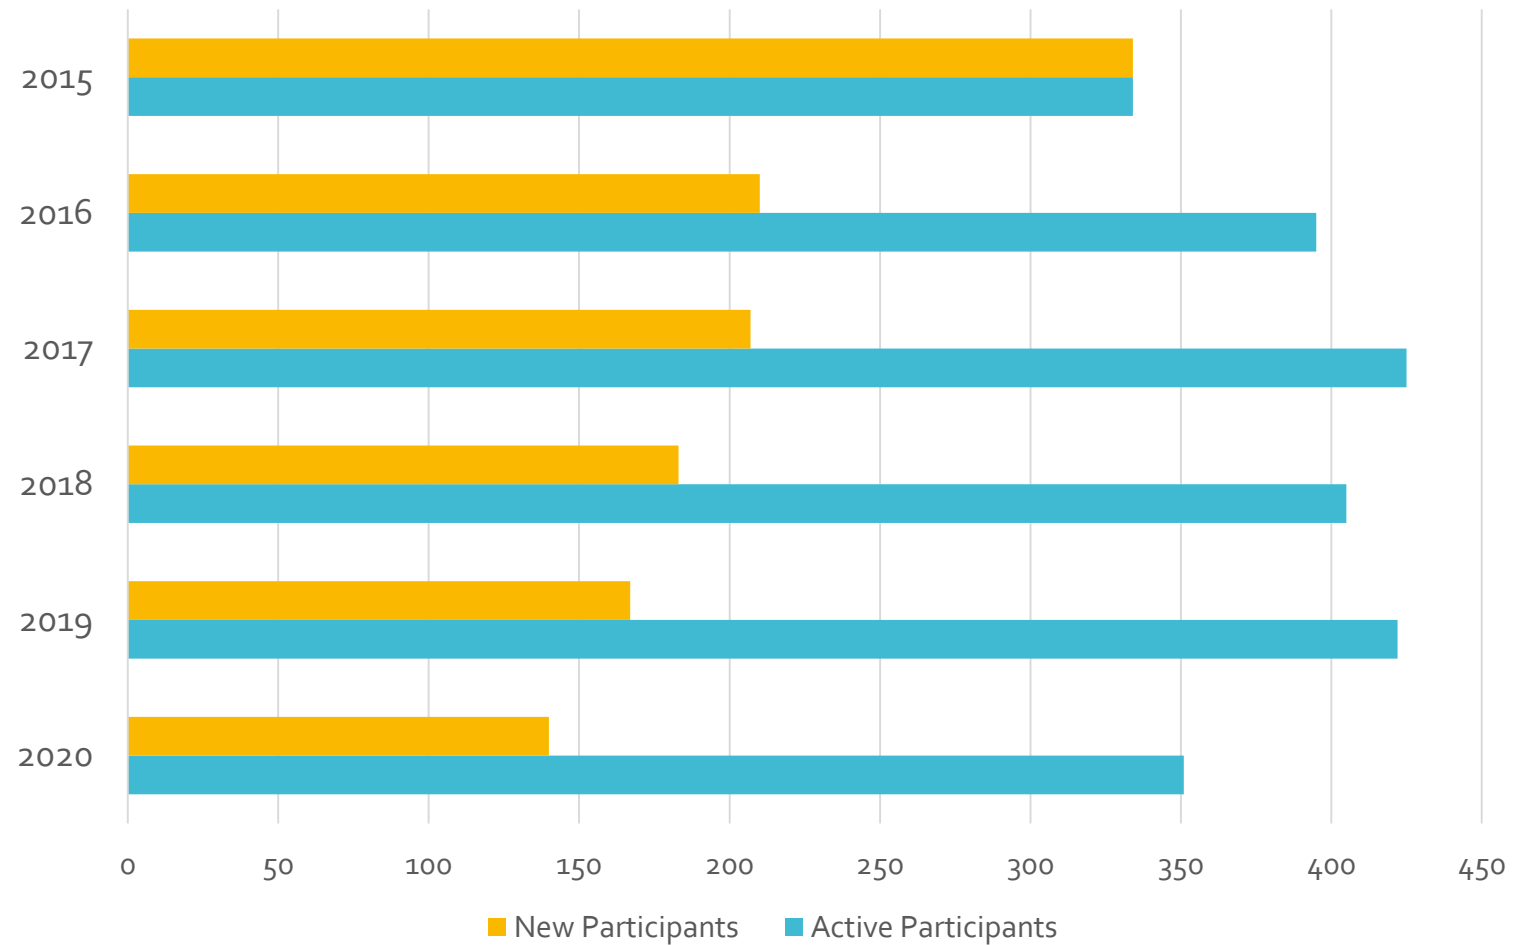

### Syringes Supplied By SSP

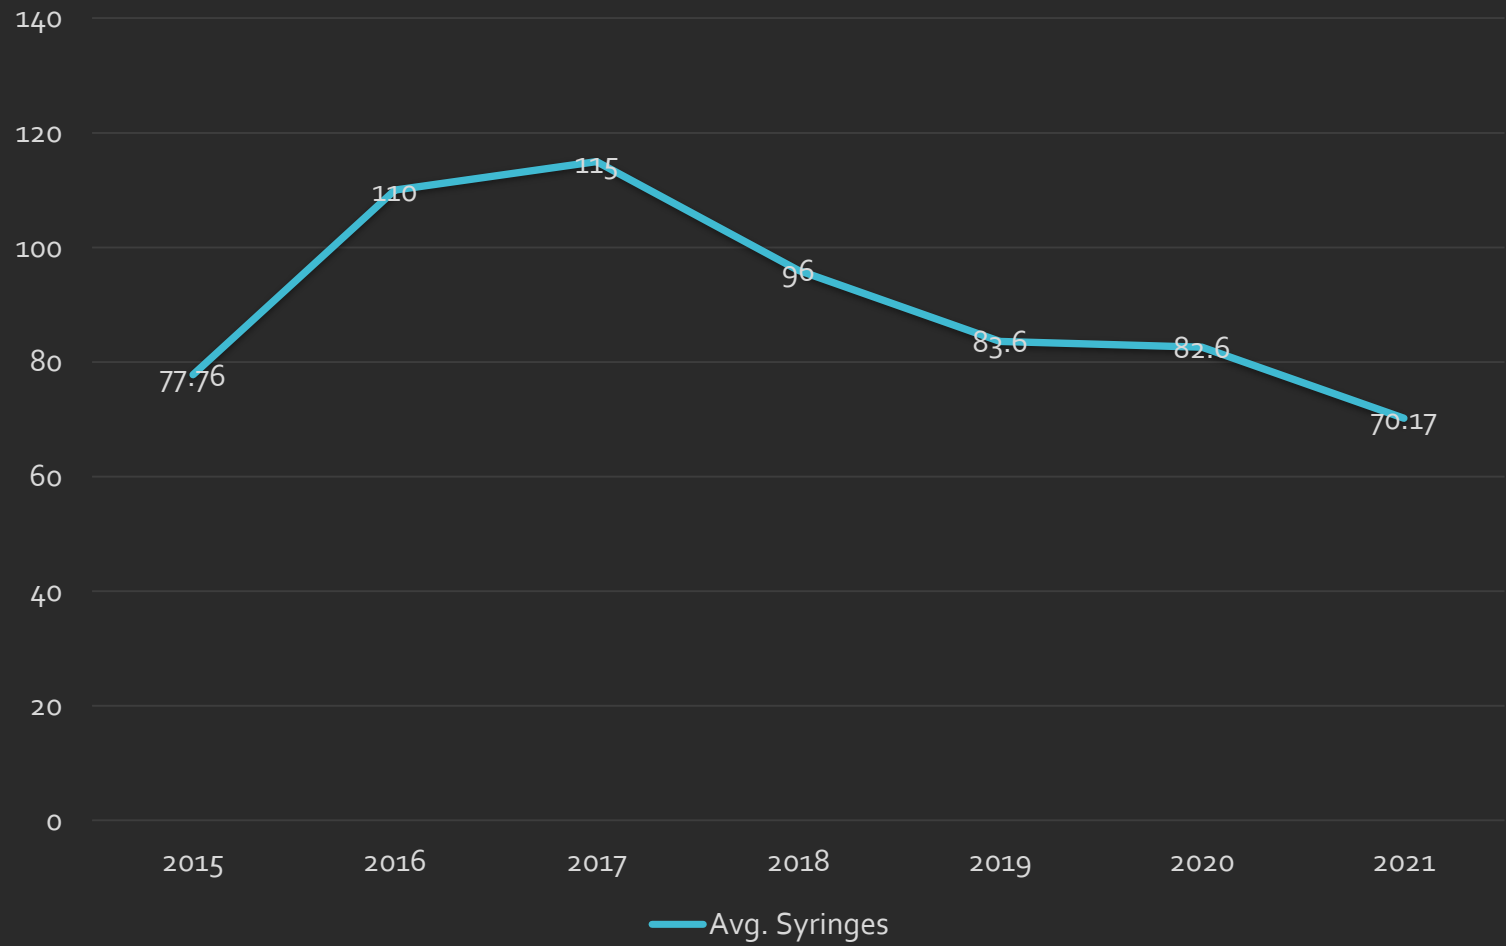

Active Participant is a person who has 1 visit to the syringe service program in the past 12 months. (IDOH)

New Participant is a person who was enrolled in the syringe service program for the first time.

## Active and New Participants

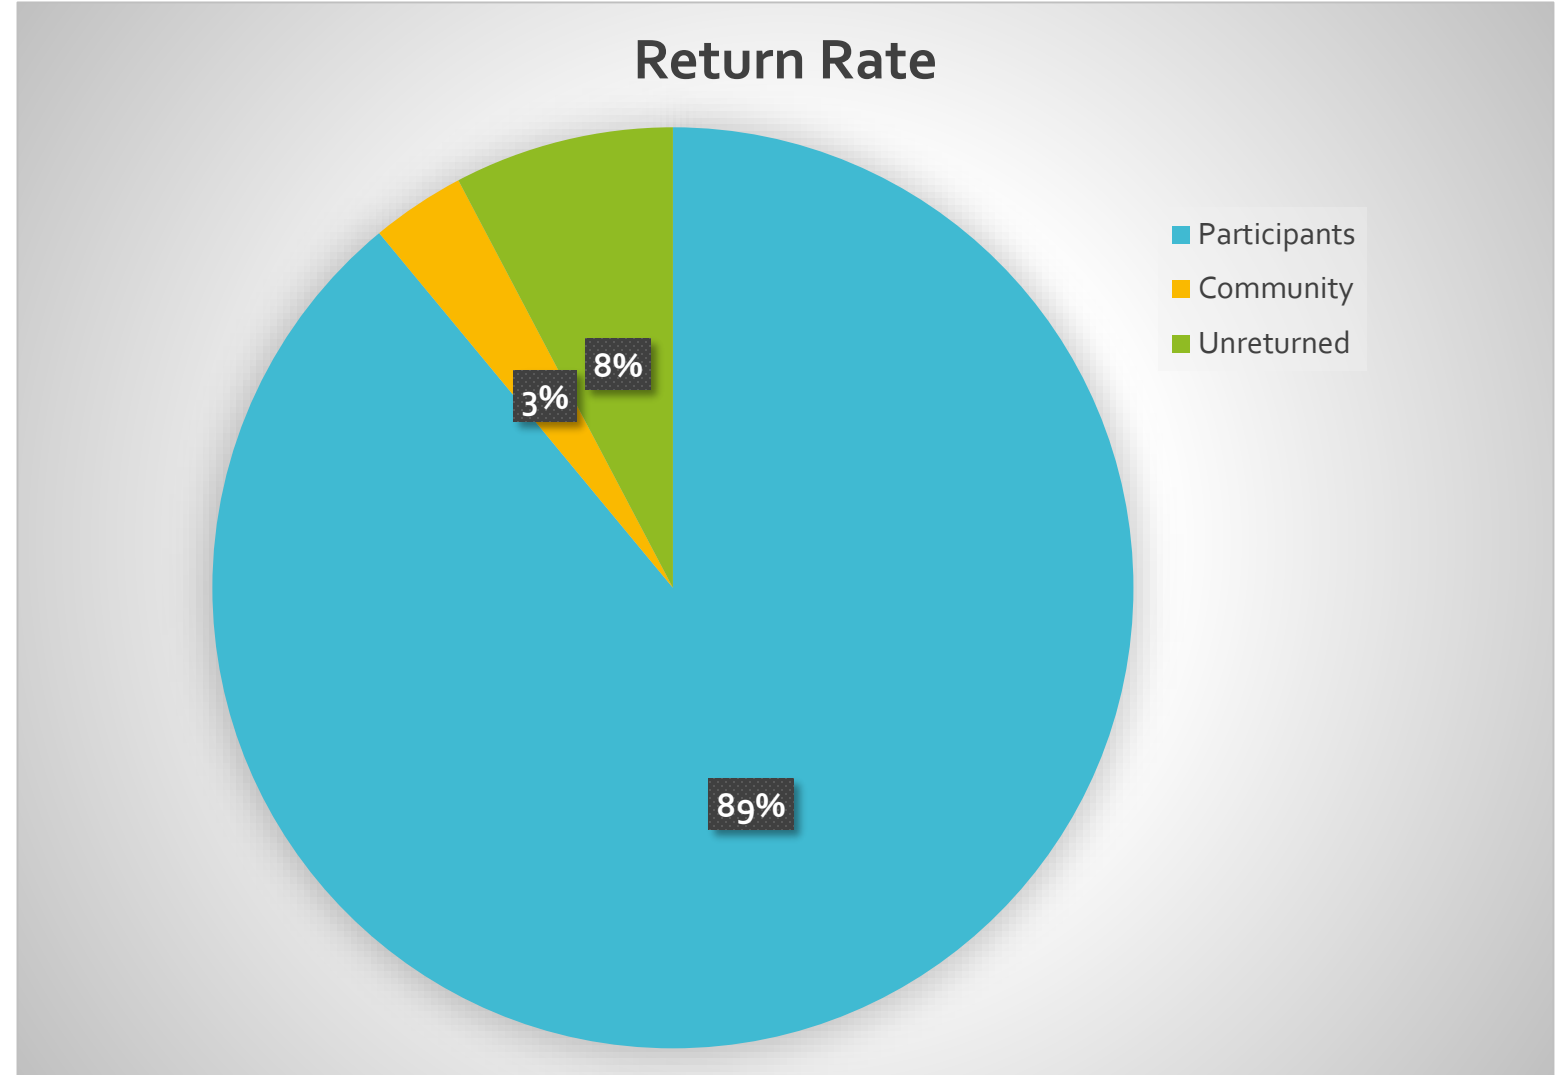

# Average Number Syringes Given/Visit

Program has a lifetime total syringe return rate of 92%.

Community returns includes lay persons, clean-ups or first responders.
